Service Levels

DineCheck project portal - proposed team plan

This plan covers access to the project website, published sprint pages, and downloadable documents. Both targets use a rolling 14-day window. Assignments, support hours, and future actions below are proposed for team adoption; these are targets, not measured results.

1. Our targets

Objective Definition and target Measurement owner

Portal availability At least 99.5% of scheduled one-minute checks succeed. A check succeeds only when the homepage and every published sprint page return HTTP 200. Zachary Carrejo: review the check log daily.

Document downloads At least 99% of daily checks of all published document links succeed. Success requires HTTP 200 and a nonempty file matching the advertised format. Jacob Ordonez: run and record the daily link check.

Measurement setup: Schedule checks and retain timestamps and results. Count a failed scheduled run as a failure until investigated; log monitoring gaps separately. Do not claim compliance without a complete measurement record.

2. Error budgets and policy

Availability budget: 14 x 24 x 60 = 20,160 minutes. At 0.5% allowed failure, the budget is 100.8 minutes (1 hour, 40 minutes, 48 seconds). With whole one-minute checks, no more than 100 failed checks are allowed to remain at or above 99.5%.

Download budget: floor(total document checks x 0.01) failed checks. For example, 15 documents checked daily for 14 days produce 210 checks and allow 2 failures. Use the actual check count; this example is not a measured total.

For either budget: At 50% used, prioritize reliability work and review upcoming changes. At exhaustion, pause feature releases and fix the affected service. Reliability fixes may continue. Resume feature releases only after the fix is verified and the affected target is met again over the rolling 14-day window.

Decision owner: Zachary, as incident commander, applies the policy using the logs; Jacob supplies download results.

Notification: Salvador informs the team and instructor within 4 support hours of budget exhaustion, explains the impact and recovery plan, and sends a daily update until recovery.

Escalation plan

3. Severity, response, and communication

Proposed support hours: Monday-Friday, 8:00 a.m.-6:00 p.m., America/Denver. Timers begin at detection during those
hours, or at the next support opening for reports received outside them. Response means acknowledging the incident
and starting investigation; it is not a guaranteed resolution time.

Severity Portal example Start fixing Tell the instructor
1 - Critical Entire portal is unavailable, or all published sprint
pages are inaccessible.
Within 1 support hour Within 2 support hours;
updates every 2 support
hours.
2 - Major One published sprint page or a required document
download is inaccessible.
Within 4 support hours Within 4 support hours;
update daily while
unresolved.
3 - Minor A typo, spacing issue, or visual defect that does not
block access.
Within 1 school day Include in the next sprint
update, no later than the
sprint deadline.

This sprint's incident roles

Role Named teammate Responsibility
Incident commander Zachary Carrejo Classify severity, assign work, authorize rollback, apply budget
policy, and confirm closure.
Fixer / operations lead Jacob Ordonez Investigate and change the site; verify affected pages and downloads
after repair.
Backup fixer / planning Daniel Lozano Track the timeline and follow-up tasks; make changes only when
assigned by the commander.
Communicator Salvador Rodarte Notify the instructor and team, send scheduled updates, and communicate recovery.

How escalation works

The person who notices the issue records the URL, detection time, symptoms, and supporting evidence, then alerts

Zachary in the team chat. Zachary assigns severity and a fixer. If Jacob cannot begin within the response target,
Zachary assigns Daniel. If Zachary is unavailable, Daniel acts as backup commander and delegates fixing to Jacob.
Only assigned fixers change the site during an incident. The communicator works from the shared incident log so
updates agree. Close the incident after the affected checks pass and the commander confirms access is restored.
Record any remaining budget restriction separately.
Review trigger: Create or update an incident review for Severity 1 or 2 incidents, an exhausted error budget, or a problem that exposes a gap
in checking or publishing.
DineCheck | Sprint 4 | Proposed Service Levels 3
TEAM 10 / SPRINT 4

Blameless incident review

4. Sprint 3 document download links

Evidence-based draft. The repository records the link defect and repair. The actual detection time, live exposure duration, and number of
affected users are not recorded in the reviewed evidence. Confirm these details from team records before publishing.

1 / Summary

Sprint 3 source contained download URLs with percent-encoded Liquid template expressions. Commit 6596c7b, titled
"Fix Sprint 3 PDF downloads," replaced these with valid PDF links, added PDF files, and expanded validation. The issue
is reviewed as a publishing and validation gap.

2 / Impact

The malformed links could prevent visitors from downloading Sprint 3 records. The reviewed source confirms defective
URLs; it does not establish which deployed versions users encountered or how many download attempts failed. No data
loss is established by the reviewed evidence.

3 / Timeline

Before repair: Sprint 3 source contained encoded template expressions in document links.
Detection: Exact time and reporting method are not recorded in the reviewed evidence.
Repair: Commit 6596c7b corrected download URLs, added PDF assets, and strengthened checks and tests.
Live recovery: Deployment and recovery timestamps must be confirmed from the deployment history; a source commit
alone does not confirm restoration.

4 / Contributing causes

The publishing process allowed encoded template syntax into link attributes. Existing validation did not reject this pattern
before the repair. A final download check was needed to verify that generated links resolved to the intended files.

5 / What went well

Version history preserved the defect and repair for review. The fix addressed both the links and the validation gap.
Added tests cover empty URLs and unresolved or encoded template expressions, reducing the chance of the same
defect recurring.

6 / Follow-up actions

Action Owner Due
Confirm detection, deployment, recovery, and actual impact from team records. Zachary Carrejo Oct 28, 2026
Run generated-site validation and open every Sprint 3 PDF on the deployed site; log results.
Jacob Ordonez Oct 28, 2026
Confirm required checks gate publishing; record the validation procedure. Daniel Lozano Oct 29, 2026
Confirm team roles and support hours; add the completed Service Levels section and review to Sprint 4.
Salvador Rodarte Oct 29, 2026
